Access denied error message when deploying a build
Alex Clemons - 2024-03-21 - Comments (0) - Lasernet FAQs

You may receive an 'Access denied' message when deploying a Lasernet build., as shown below:

This is normally caused by the *Client Secret* set in the License Manager not matching the one stored against the Server in the Config Portal.
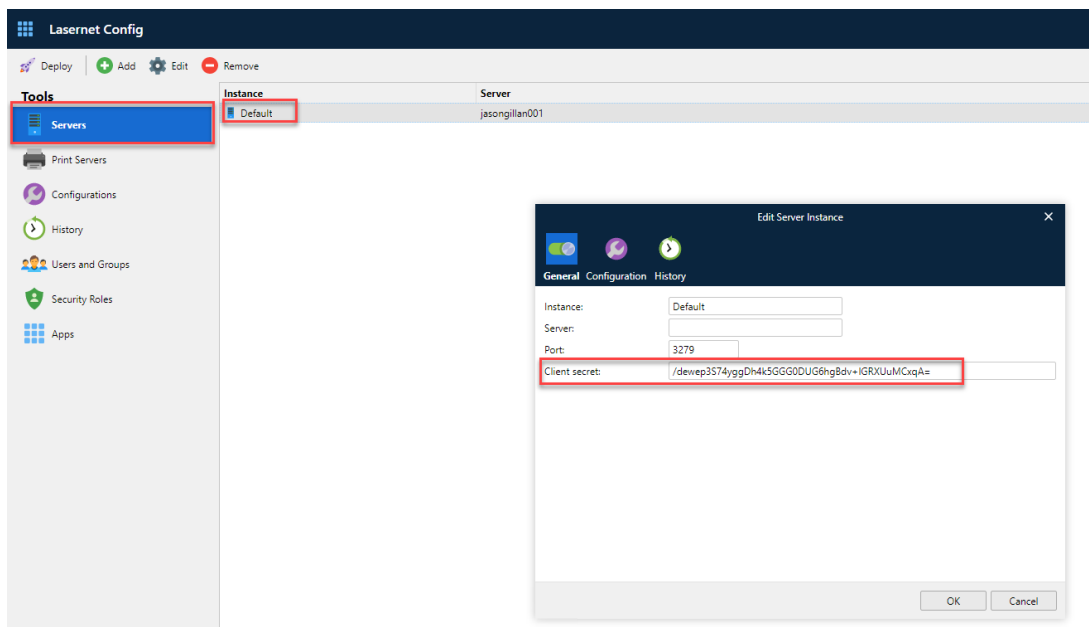

Solution

To resolve this issue, please follow these steps:

1. Open Lasernet License Manager and select the required instance from the list.

2. Click the **Edit** button and copy the *Client Secret*.

3. Open the Lasernet Config Portal and select the same instance from the list.

4. Click the **Edit** button and paste the Client Secret into the *Client secret* field.

See section "5.2.2 Add Server" of the Lasernet Config Manual for further details.
