

Compilation Error from Lasetnet FO Connector 6.17

Kate Coles - 2023-12-01 - Comments (0) - Lasetnet FO Connector FAQs

Lasetnet for Dynamics 365

Customers that have developed code to initialize Lasetnet reports in Lasetnet FO Connector prior to version 6.17, will get a compilation error when they upgrade to Lasetnet FO Connector 6.17 because report initialization from the code has changed in this version.

Error

Type mismatch in 'LACRunQueryServiceController.newReport' argument 2. The expected type is 'LACArgsCache', but the actual type is 'boolean'.

Lasetnet FO Connector 6.17 contains major enhancements related to performance. One of the newly introduced features is a new logic for the cache. This change affects the way the report is initialized and processed from the code.

It might be required that some customers having custom code to launch Lasetnet reports have to update the code.

The Lasetnet tutorial is also updated to give users an understanding of using Lasetnet features from the code. **LACTutorialStartReport** shows the changes that might be required to follow.

Older Lasetnet FO Connector version:

Lasetnet FO Connector 6.17:

Code fragment to initialize **LACRunQueryServiceController**:

```
LACRunQueryServiceController controller =  
LACRunQueryServiceController::newReport("LACCustTable",  
LACArgsCache::newCache('LACCustTable'), true);
```

In case there is no Report in the scope/context of the process, LACArgsCache should be initialized with an empty string:

```
LACArgsCache argsCache = LACArgsCache::newCache("");
```

The following is an example that should be followed:

The updated tutorial model has been added to the Lasernet FO Connector 6.17.1 release.
