This article explains the process of how to set up and connect to a client via an Azure Hybrid Connection. Please follow these steps:

1. Open **Azure** and create a relay.
2. Click **Hybrid Connections**.

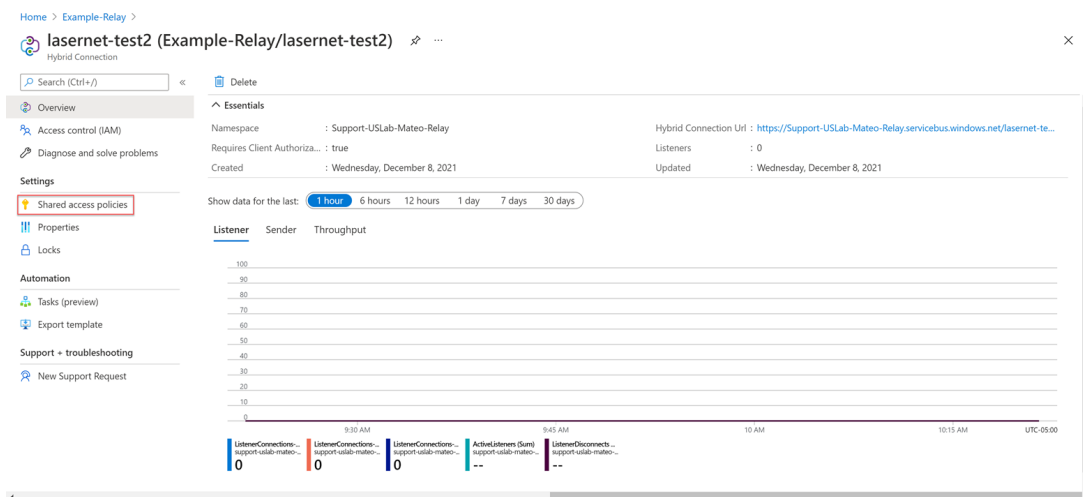

The screenshot shows the Azure portal interface for a relay named 'Example-Relay'. The left-hand navigation pane is visible, with 'Hybrid Connections' highlighted in a red box. The main content area displays the relay's details, including its resource group, status, location, and subscription ID. A graph at the bottom shows throughput data for the listener, sender, and throughput over time.

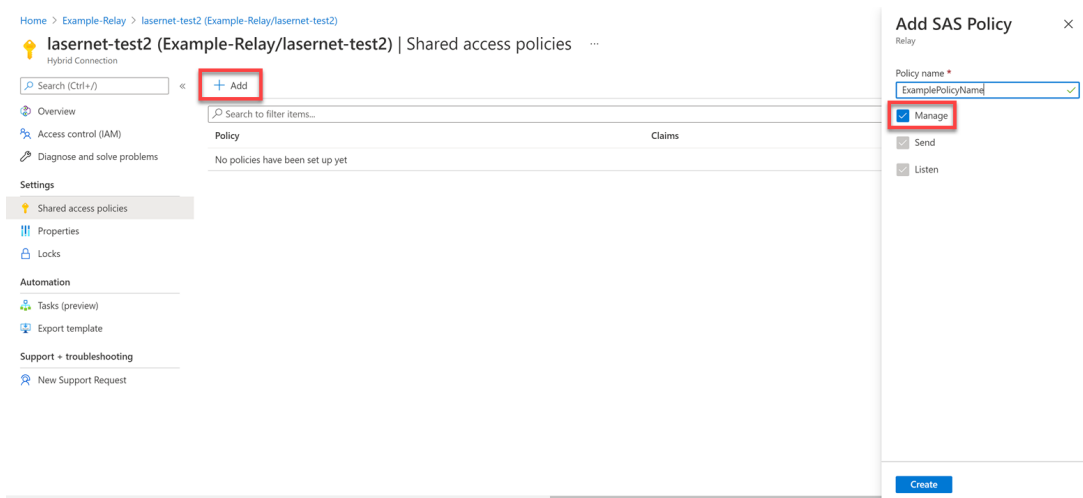

3. Click the **Add Hybrid Connection** button.

4. Once you have created your Hybrid Connection, the following page is displayed. Click **Shared access policies**.

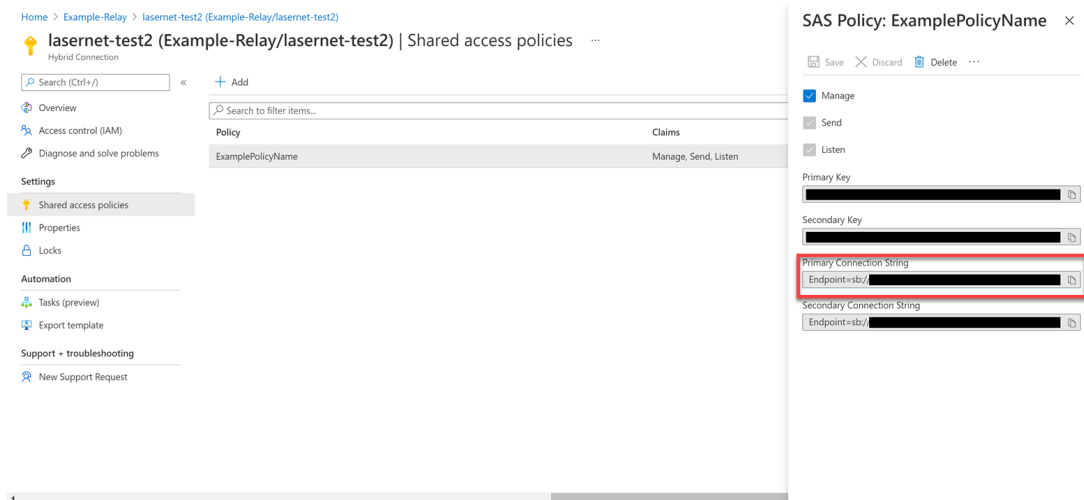

5. Click **Add** to create a new policy and ensure the **Manage** checkbox is cleared.

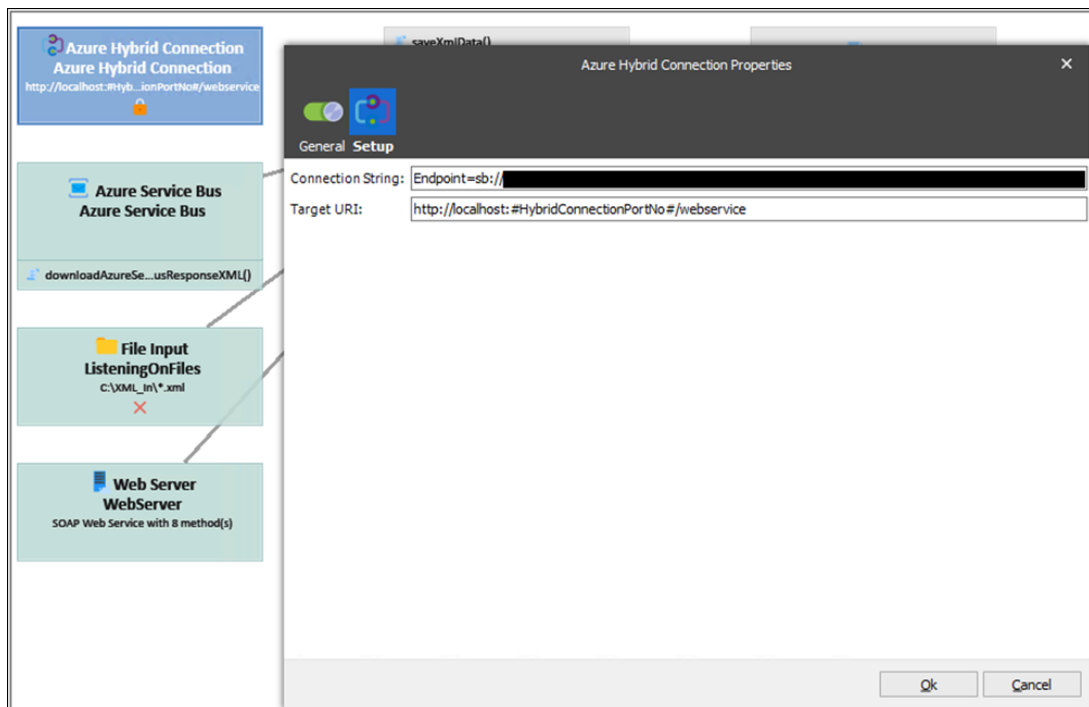

After it has been created, you will be able to see the "Shared access policy" displayed in the *Policy* box.

6. Click the policy to open a menu on the right side and copy the **Primary Connection String**. It should start with Endpoint=sb://Relay-Name.

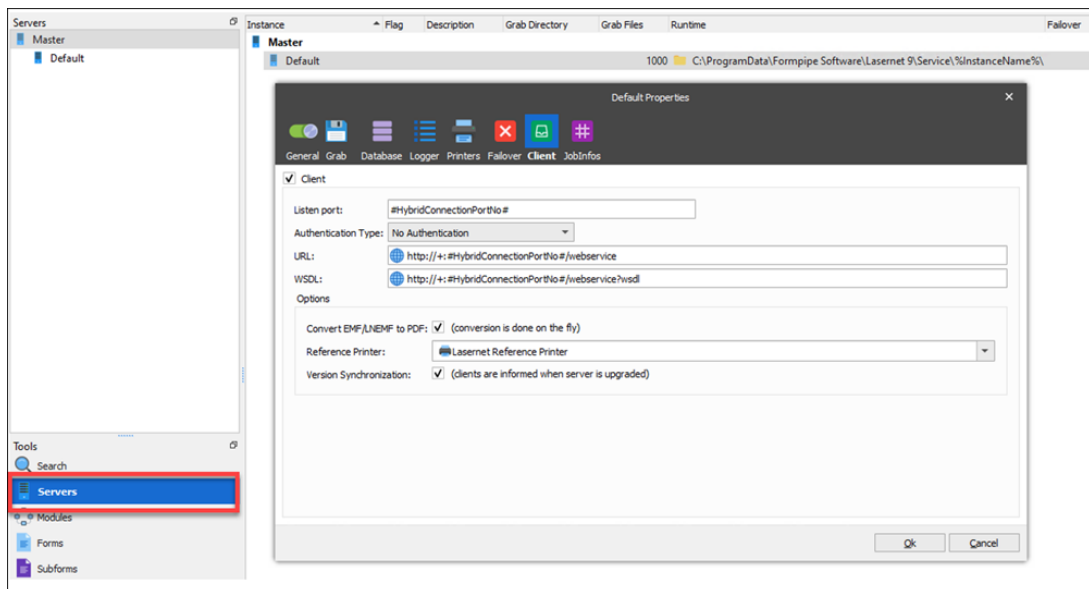

7. Log into **Lasernet Developer** and Create a Module for an Azure Hybrid Connection.

8. Paste the Connection String into the **Connection String** field. Ensure your Target URI looks similar to the image below:

9. After the Connection String has been saved, navigate to the **Servers** section under *Tools*, click the server that you are using for the Lasernet Developer, and ensure the *Client* tab is configured correctly.

10. Open **Client** (if this is your first time opening the Client, a popup window will appear) and add an instance.
11. When the *Options* window appears, ensure you are viewing the **Client** tab.
12. Select **Hybrid Azure Connection** and paste the Connection string into the field.
13. Click the **Test** button to test the connection and you should get a popup saying the connection was successful.
