

## Lاسernet Developer

Haveela Anil - 2024-07-16 - Comments (0) - Lاسernet Architecture

The Lاسernet Developer provides an easy-to-use environment for configuring and maintaining input and output management workflows. It brings together a number of comprehensive tools that enable a developer to set up documents, work with data, set business rules and logic, communicate between modules and environments (mail server, web server, printers, etc), and use design features.

To learn more about the Lاسernet Developer, see the [Lاسernet Developer Guide](#).

The following diagram provides an overview of the core components of Formpipe's Lاسernet, numbered 1 to 11.

1. Lاسernet Developer is a Windows application to develop, commit, and deploy configurations to the Lاسernet Server. You can set up documents in a wide range of input and output formats, with business rules and logic that communicate between modules and environments.
2. Lاسernet Config is a server management website that administers the repository and history of configurations, client or server settings, users, groups, and security roles.
3. Lاسernet Monitor is a Windows or web application that monitors the service log processed by the Lاسernet Service Instances. This log can either be the live log for jobs currently being processed or log data saved for older jobs that have already been processed.
4. Lاسernet Client is a Windows or web application to view and manage documents temporarily stored in the MS SQL Job Database. For the documents, you can perform tasks such as editing JobInfos, re-scheduling, searching, viewing, removing, and releasing scheduled, failed, or paused jobs.
5. Lاسernet OCR is a Windows application to develop, commit, and deploy OCR Forms used for maintaining incoming business information and the easy extraction of data for import directly into your workflow system. By setting up simple text recognition, you can work with data fields in forms such as invoices, order confirmations etc.
6. Lاسernet Config Server is a service that runs the config website and acts as a relay proxy between the Lاسernet applications and the Lاسernet servers.
7. The MS SQL Config Database acts as a database backend for the Lاسernet Config Server. It stores the server settings, configurations, repository, history, users, groups,

and security profiles. Lasernet 10 is by default installed with an MS SQL Local DB, but upgrading to MS SQL Server is recommended. Configurations can be exported and imported between multiple Lasetnet Config Servers running Dev, Test, or Prod environments.

8. The Lasetnet Server Instances run the workflows and process the documents in your Dev, Test, and Production environments, which are deployed from the Lasetnet Developer.
9. The MS SQL Job Database acts as a database backend for the Lasetnet Service Instances. It stores paused, scheduled, or failed jobs. Lasetnet 10 is, by default, installed with an MS SQL Local DB, but upgrading to MS SQL Server is recommended. You can view and manage temporary stored documents from the Lasetnet Client.
10. Lasetnet License Manager is a Windows application to add licenses for your server environments and modules.
11. Lasetnet provides several authentication methods ranging from local users to full SSO integration. Full support and guidance are provided when utilizing an external user identity directory, allowing customers to integrate with existing authentication infrastructure, like Microsoft AD and Entra ID.

#### Note

Lasetnet 10 is built on C++, C#, JavaScript and approved on Windows 10, Windows 11, Windows Server 2019 and Windows Server 2022.
