

Using Direct OData Submit and Direct Button with Workflow in D365CE

- 2023-03-29 - Comments (0) - Lasetnet CE Connector General Information

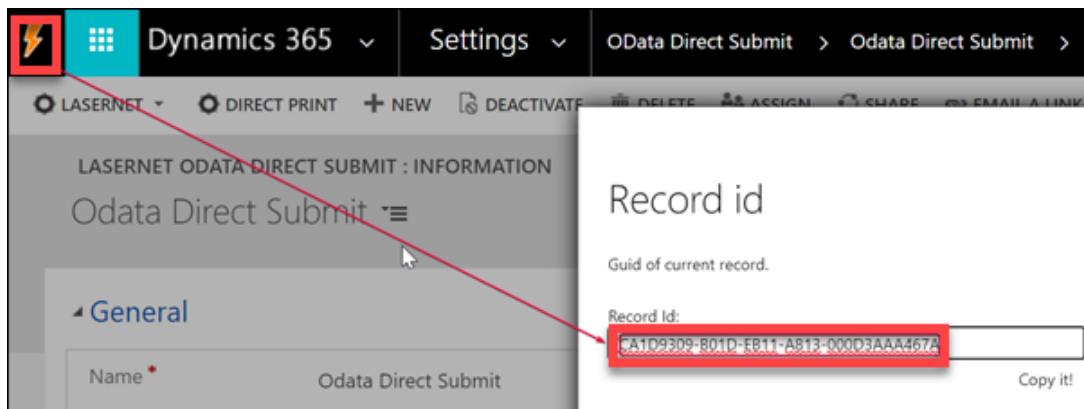

Lasernet for Dynamics 365

This article describes the steps required to set up a workflow in D365 CE to invoke the plugin for submitting printing contracts to D365FO. This will allow an Odata dialog printing contract to be sent to D365FO in response to an event in D365 CE.

There are two ways to invoke the logic in D365 FO without user-interaction, either using a direct OData submit or by using a direct button which then invokes direct OData submit. The advantage of using the logic for direct buttons is that it is not needed to hardcode the process/caller to a direct OData submit record ID. Instead, it is mapped to the control ID on the Lasernet Button form, which then maps to the direct OData submit or HTTP method. Performance is better when using direct OData submit, however, it's easier to maintain a direct button.

Using Direct OData Submit

1. Create a Lasernet Direct OData submit record. It is recommended to test and confirm that it is working by attaching it to a flyout or button.
2. Obtain the ID of the Lasernet Direct OData submit record and copy it from the URL. There are several ways to do this. In this example, Power pane Plugin in the browser is used to get the Record ID.

3. Create a new process/workflow for the entity in question.

If this process is an action and you want to use it in a Business Process Flow, then select the **As a Business Process Flow action step** checkbox and set "As an on-demand process", if required.

4. Add the step Lasernet.Unified.Printing.Activities.ODataDirectSubmit.

5. Set "The ID of OData Direct Submit" to the ID you found in step 2.

6. Set "Inbound serialized contract (will be returned)" to a JSON object. OrgName is currently a requirement in D365 FO, so add it (either hardcode or using arguments).

OrgName can be found from the Developer Resources area under **Settings > Customizations**. The JSON object will be sent to FO, where it can be used for report mapping and filtering.

You can also set the remaining fields, however, they are optional.

7. Add your own logic to the process and/or set when it should be started and activate it.

Optional

Option 1 : Set Properties for Workflow Activity for

Lasernet.Unified.Printing.Activities.ODataDirectSubmit

The screenshot displays the 'Set Custom Step Input Properties' dialog for the 'Call OData Direct Submit' process. The 'Process Name' is 'Call OData Direct Submit' and it is set to 'Process'. The 'Available to Run' section has 'As an on-demand process' checked. The 'Options for Automatic Processes' section shows 'Scope' as 'Organization' and 'Start when' as 'After'. The 'Execute as' section has 'The owner of the workflow' selected. The 'Workflow Log Retention' section has 'Keep logs for workflow jobs that encountered errors' checked. The 'Set Custom Step Input Properties' table is as follows:

Property Name	Data Type	Required	Value
The ID of OData Direct Submit	Single Line of Text	Required	CA109309-B01D-EB11-AB13-00001AAA467A
Inbound serialized contract (will ...	Single Line of Text	Optional	{"OrgName": "org1a604ca1"}
The entity-type of the primary e...	Single Line of Text	Optional	
The entity-type of the selected e...	Single Line of Text	Optional	
If multiple records have been sel...	Two Options	Optional	<input type="radio"/> False <input type="radio"/> True
The role-names which should be...	Single Line of Text	Optional	
The role templates which should...	Single Line of Text	Optional	

The 'Add Step' button is highlighted in red. The 'Lasernet.Unified.Printing (1.1.0.0)' activity is selected in the activity list, and the 'Lasernet.Unified.Printing.Activities.ODataDirectSubmit' activity is highlighted in red in the expanded view.

Option 2: Add a workflow action and specify OdataDirectSubmitId and Inbound Contract

You can also set the remaining fields, however, they are optional.

7. Add your own logic to the process and/or set when it should be started.

8. Activate it.
