

## Autoform DM 9.2

2020-12-18 - Ross Glover - Comments (0) - Autoform DM Release Notes

# AUTOFORM | DM

### DM Release Version 9.2.0

**Release date:** 18th December 2020

### New Features

The following new features have been added since our last release:

#### Document Encryption

We have added an additional layer of protection against unauthorised access or processing of sensitive data. Autoform DM can now be configured to perform application-level encryption of document files.

#### Elastic Document Keys

An *indefinite* number of keys can now be stored against your documents giving you the flexibility to store your data how you want.

For a more detailed description of these new features, please see our [New Features](#) page.

### Performance Improvements

The following performance enhancements have now been implemented:

- Optimised use of EJBs.
- Optimised caching of users and document archive paths.
- Utilised Hibernate's Natural ID cache.

### Usability Improvements

The following usability enhancements have now been implemented:

- Removed 'consecutive character' option from password settings.

- Improved usability of the REST SDK deliverables.
- Standardised navigation of the home button across admin screens.
- Removed Basic/Advanced buttons from all screens, the default now shows all options.
- Invalid name identifiers now cause the upgrade to fail (with options for resolution), rather than silently causing residual problems.

## Fixes

The following list contains details of fixes we have implemented since the last release:

- Fixed incorrect display of document definition filename format
- Key definitions created using 'quick-create' now correctly preserve a 'dirty' state in the bindings screen.
- Error handling improved when cloning/creating users with an already-in-use username
- Note/Group label updates no longer incorrectly update the name.
- Resolved browser caching issue with CSS and js in the web-integrations module.
- Addressed many missing database constraints.
- Configuration import no longer fails when a search and document definition are being removed at the same time.
- Resolved issue causing the configuration import to lock and time-out in some cases.
- The 'New Key Definition' button no longer overlaps longer key definition lists.
- Improved error handling with unbinding document definitions from searches.
- Correct key icons are now displayed.
