Enhancements and Fixes - Lasernet BC Connector 4.3.2.0

#395876 – The nomenclature 'Job' has been changed to 'Project' by Microsoft ® in BC24

Starting from Business Central 24, Microsoft ® has changed the nomenclature 'Job' to 'Project' in several different functions. Therefore, we have updated Lasernet BC Connector's report names, Placeholders, and Email templates accordingly to reflect this change.

The following are some examples:

- **Project Quote** instead of **Job Quote**

- **PROJECT** and **PROJECTNO** instead of **JOB** and **JOBNO**

- **Project Quote** and **PROJECTNO** instead of **Job Quote** and **JOBNO**

- **Project No.** instead of **Job No.**

#412439 – An issue has been addressed regarding the searchability of Lasernet reports
In previous versions, when using the **Search** function, for example, to look for **Production Order - Job card** to print the **Job card** report, only the standard BC report would appear, while the Lasernet report would be disregarded.

This bug has been fixed for the following reports:

- Prod. Order - Job Card (99000762)

- Whse. - Posted Receipt (7308)

- Whse. - Posted Shipment (7309)

- Whse. - Receipt (7316)

- Whse. - Shipment (7317)

#424923 – When adding a new Filter or Document Layout, Field No. is deactivated by default
In previous versions, when adding a new **Filter** or **Document Layout** to Lasernet BC Connector, **Field No.** was deactivated by default, which caused unwanted data to be stored in the XML file.

This has been fixed, and **Field No.** is now active by default.

#424925 – ApplicationInsightsConnectionString is obsolete
In previous versions, our telemetry was broken, so a new one had to be created.

Therefore, the updated **ConnectionString** is now included in our code.

#425780 – Report Selection is now automatically activated when Report Setup is selected during an export
As requested by our partners, **Report Selection** is now automatically activated when **Report Setup** is selected during an export (**Export** function).

We have also moved the **Report Selections** option below **Report Setup**.

#427106 – Data Formats now supports the Julian calendar format with YearDay function
Data Formats has been enhanced to support dates in the Julian calendar format with a new function called **YearDay**.

For instance, the date 12-06-2024 will be formatted 163, because the 12th of June 2024 is the 163rd day of the year.

#427106 –Several suggested formats have been added to Data Formats
Along with the new functionality **YearDay** for the Julian calendar, other often-used formats have been added to our suggestion list.

#429543 – Item GTIN Label report can now be substituted with Lasernet Item Label report
Lasernet BC Connector already included the Item GTIN Label report. Starting from version 23, this report is also included in Microsoft's ® Business Central suite.

Item GTIN Label report can now be substituted with Lasernet Item Label report when the latter is active.

#431040 – The ApplicationArea property is missing from the controls of the File Formats and Custom Port pages
In previous versions, the **ApplicationArea** property could sometimes be missing from the controls of the **File Formats** and **Custom Port** pages. This prevented the user from adding or deleting new **Custom Ports** or **File Formats**.
